Cable Distributed Fault Diagnosis Device is an advanced monitoring system installed on cable lines. It utilizes distributed traveling wave ranging technology, transient signal monitoring and intelligent algorithms to monitor the operating status of cables in real time, quickly and accurately locate fault points and identify fault causes. It is suitable for cable lines with voltage levels ranging from 35kV to 500kV. This device collects fault traveling wave and power frequency current signals by installing monitoring devices at both ends of the cable. Combined with optical fiber communication and GPS timing technology, it realizes the rapid location and early warning of faults. It is widely used in transmission lines, substations and industrial parks of the power system, which can significantly enhance the reliability, safety and maintenance efficiency of cable operation, and reduce the cost of fault detection.
