The global Wafer Cleaning Agent market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Wafer Cleaning Agent refers to a type of chemical solution or cleaning agent that is used in the production of semiconductor wafers. The cleaning process of wafer cleaning agents primarily involves the removal of impurities and contamination from the surface of semiconductors. The cleaning agents are designed to efficiently remove any oxides, particles, or other residues that may exist on the surface of the wafers.

The wafer cleaning agents are essential during the manufacturing process of semiconductor devices as they ensure that the wafers are thoroughly cleaned before new layers or films are deposited onto them. Wafer cleaning agents are used in a variety of applications, including cleaning of silicon wafers, gallium arsenide wafers, and quartz crystal microbalance (QCM) sensors. They are also used in the cleaning of various tools and equipment employed in the semiconductor production process.
