Abstracts

According to our (Global Info Research) latest study, the global Wafer Dry Cleaning Equipment market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Dry cleaning equipment is used to clean semiconductor wafers without the use of liquids or solvents. This type of cleaning is often preferred over wet cleaning because it eliminates the risk of residue and reduces the risk of particle contamination. Dry cleaning equipment can come in different forms such as plasma cleaning equipment, vapor phase cleaning equipment, and physical cleaning equipment such as mechanical and thermal cleaning systems.

? Plasma cleaning, vapor phase cleaning, and physical cleaning are all methods used to remove contaminants from surfaces in the semiconductor industry. Each method has its own advantages and disadvantages and the best method to use depends on the specific cleaning requirements.

? Plasma cleaning uses a plasma discharge to remove contaminants from a surface. This method is effective for removing organic and inorganic materials, but it can also cause damage to the surface if not controlled properly.

? Vapor phase cleaning uses solvents that are heated to a temperature at which they vaporize. The vapor then reacts with the contaminants on the surface to dissolve or remove them. This method is effective for removing organic contaminants, but it can also be expensive and time-consuming.

? Physical cleaning involves using physical means such as brushing or blasting to remove contaminants from the surface. This method is effective for removing particles and debris, but it may not be as effective for removing more stubborn contaminants.

In summary, plasma cleaning is effective for removing a wide range of contaminants, vapor phase cleaning is best for removing organic materials, and physical cleaning is best for removing particles and debris.
