Abstracts

The global Wafer Inspection Equipment market size is expected to reach \$ 1881 million by 2032, rising at a market growth of 8.9% CAGR during the forecast period (2026-2032).

Wafer inspection equipment is part of semiconductor capital equipment. These systems are essential in the semiconductor manufacturing process as they help maintain the performance of semiconductor ICs by identifying the impurities or defects in the wafers during the manufacturing process. Semiconductor device manufacturers - foundries, memory device manufacturers, and integrated device manufacturer (IDMs) - are the principal customers for the semiconductor capital equipment vendors.

In 2025, global Wafer Inspection Equipment sales volume reached 376 units, with average price of 2620 k US\$ per unit.

Advanced nodes are increasing the need for tighter process control. As logic, foundry, DRAM, and 3D NAND processes move toward smaller critical dimensions and more complex structures, wafer inspection and metrology systems are becoming more important for yield control. Defect tolerance is shrinking, overlay requirements are stricter, and process windows are narrower, so fabs need more frequent inspection and more accurate metrology at each major process step. ASML describes optical and e-beam metrology/inspection tools as systems used to measure pattern quality before and during high-volume chip manufacturing, showing that inspection and metrology are now embedded directly into advanced production control rather than being only final quality-check tools.

AI, HPC, and advanced memory are driving equipment demand. Demand for AI

accelerators, high-performance computing chips, and HBM is pushing foundries and memory makers to expand advanced capacity. SEMI projected continued growth in wafer fab equipment spending as chipmakers add capacity for AI accelerators, HPC, premium mobile processors, DRAM, and HBM, which directly benefits inspection and metrology suppliers because every new advanced fab requires process-control tools.

Advanced packaging is becoming one of the fastest-growing application areas. Wafer inspection and metrology demand is expanding from front-end wafer fabrication into advanced packaging, including fan-out, 2.5D/3D packaging, chiplets, TSV, hybrid bonding, micro-bumps, and HBM integration. Onto Innovation reported a large volume purchase agreement with an HBM manufacturer for 2D inspection and 3D bump metrology, which reflects how packaging yield control is becoming critical as AI chips rely more heavily on high-density interconnects and multi-die integration.

E-beam inspection is gaining importance for nano-scale and hard-to-detect defects. Optical inspection remains the high-throughput mainstream solution, but e-beam inspection is increasingly used for advanced nodes where defects are too small or too complex for traditional optical methods. ASML states that its HMI e-beam solutions help locate and analyze individual chip defects among millions of printed patterns, and its eScan 1000 uses multibeam technology to improve inspection speed compared with previous e-beam tools.

Metrology is shifting from 2D measurement to 3D structural control. The market is moving beyond simple linewidth, overlay, and film-thickness measurement toward 3D profile, topography, bump height, wafer warpage, TSV/TGV, and high-aspect-ratio structure measurement. This is especially important for 3D NAND, FinFET/GAA logic, MEMS, compound semiconductors, and advanced packaging. The technical direction is toward non-destructive, high-resolution, multi-parameter metrology that can measure both surface and buried structures without slowing production too much.
