## Abstracts

The global Wafer Thinning and Dicing Film market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Tapes are mainly used in two major processes of wafer back grinding and wafer dicing in semiconductor applications. Both grinding tape and dicing tape include Non-UV Tape and UV Tape. Non-UV type refers to the general traditional pressure-sensitive adhesive tape. Considering the ease of peeling, its adhesive force is generally lower than that of UV type (before UV exposure), which is about 100~400 gf/25mm. UV tape is a pressure-sensitive tape with high adhesive strength before exposure, and its peel force will be greatly reduced after exposure to UV light. Wafer back grinding tape (BG Tape) mainly refers to the protection and fixation of the front circuit of the wafer when the back grinding is thinned after the wafer is manufactured, and prevents damage to the front circuit of the wafer during the back grinding of the wafer. The dicing tape (Dicing Tape) is mainly used for fixing, dicing, expansion, UV debonding, separation, etc. in the semiconductor wafer and packaging process.
