Abstracts

According to our (Global Info Research) latest study, the global Walk-in Salt Spray Chamber market size was valued at US\$ 635 million in 2025 and is forecast to a readjusted size of US\$ 911 million by 2032 with a CAGR of 5.3% during review period.

In 2025, global walk-in salt spray chamber production reached approximately 23740 units, the average price is 26 k usd/unit. A walk-in salt spray chamber is a large-scale environmental testing chamber that can be entered by personnel. It is used to simulate the corrosive conditions caused by the ocean/salt atmosphere, and to implement controlled salt spray deposition, humidity and temperature in the inner cavity. It can also form a cyclic corrosion program to meet industry standards and is suitable for product-level durability verification of vehicle parts, structural components and other products.

Market Concentration and Major Players:

Internationally, the market concentration of walk-in salt spray chambers is relatively high, mainly concentrated in developed countries in Europe and America. Large manufacturers include Labtech Instruments and Weiss Technik. Domestically, there is significant room for development in the walk-in salt spray chamber market.

Manufacturing Process and Market Trends:

The manufacturing of walk-in salt spray chambers uses a load-bearing steel frame as the base, covered with corrosion-resistant inner liner panels. Mainstream designs use PP or PVC panels, hot-air welded together with rounded transitions. High-end solutions use mirror-finished stainless steel with argon arc welding or laser welding for sealing.

The outer liner is covered with A3 steel powder-coated material and filled with polyurethane foam for insulation. The top plate is angled at 110 degrees to allow condensate to flow back along the walls without dripping. A door with three fluororubber stepped seals and an observation window are then embedded. Internally, a tower-type sprayer with multiple branches for salt water supply and a saturated air tank is installed. Heating is typically achieved using titanium pipe water tanks for temperature equalization or indirect steam heat exchange. After the air circulation and drainage systems are completed, the entire machine undergoes salt spray uniformity and leakage calibration before delivery.

Market demand is driven by the verification of sealed battery packs for electric vehicles, high-reliability components for aerospace, and export compliance. Equipment is evolving from static salt spray to salt spray, wet heat, and drying cycle corrosion and multi-field coupling in parallel. The control end is accelerating towards IoT remote monitoring, auditing, traceability, and data-driven corrosion life prediction. At the same time, the closed-loop energy recovery of brine and explosion-proof safety design raise the engineering threshold. Small and medium-sized customers also prefer to outsource testing to third parties rather than build their own systems.
