The global Walking Aid Sling market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A walking sling is a medical aid used to assist patients in need of rehabilitation with walking training. It usually consists of a set of harnesses, ropes, hooks, and anchors that can be attached to different parts of the patient's body to provide support and stability, help the patient maintain balance, and provide additional support when walking. Assisted walking slings are usually adjusted and used by healthcare professionals according to the patient's specific situation and rehabilitation goals. Harnesses and cords are usually attached to the patient's back, waist, pelvis, thighs, or lower legs to provide support and stability. Hooks and fixtures can be attached to equipment such as brackets, ceiling suspension or floor suspension for patient safety and stability. Walking slings are often used in rehabilitation, for example for patients who have difficulty walking or are disabled due to stroke, spinal cord injury, motor neuron disease, etc. Through training with a walking sling, patients can engage in muscle building, balance training, gait recovery, and simulation of activities of daily living to facilitate recovery and improve quality of life.
