Walking beams and push rods are used together in industrial production lines (such as heat treatment furnaces, forging lines, coating lines, etc.). It is a design of a coordinated material transfer system to achieve segmented continuous conveying and precise positioning. Walking beams: Through periodic lifting and translational movements, materials (workpieces, billets, etc.) are gradually pushed into the furnace or processing area at a fixed beat to ensure continuous movement of materials in high temperature or processing environments without friction (avoiding scratches). Pushers: Use linear hydraulic/pneumatic drives to push materials from static stations (such as loading platforms) into the starting position of the walking beam, or push materials to the next station (such as cooling area) after a specific process.

This report is a detailed and comprehensive analysis for global Walking Beams and Pushers market.
