The global Waste Separation and Sorting Technology market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Waste separation and sorting technology refers to the various processes, equipment, and techniques used to separate, categorize, and sort different types of waste materials from mixed waste streams. The primary objective of waste separation and sorting technology is to recover valuable and recyclable materials, reduce the volume of waste sent to landfills or incineration, and promote recycling and resource conservation. This technology is employed in waste management facilities, recycling centers, and material recovery facilities (MRFs).

This technology involves using equipment and methods like conveyors and mechanical sorting, magnetic and optical sorting, and robotic technology to separate recyclable materials from mixed waste streams. Waste separation and sorting technology is an essential component of modern waste management infrastructure. It helps enhance the efficiency of recycling programs, reduce waste sent to landfills, and contribute to sustainable waste management practices.
