According to our (Global Info Research) latest study, the global Wastepaper Management market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The recycling of paper is the process by which waste paper is turned into new paper products. It has a number of important benefits: It saves waste paper from occupying landfill and producing methane as it breaks down.

The paper and pulp industry is one of the major energy-consuming industries. The energy consumption in this industry is directly influenced by the volumetric demand for new paper. End-users such as government offices, corporate organizations, and educational institutes exhibit strong demand for paper. The growing demand for paper from these end-users is resulting in an increase in GHG emissions as most of the global energy needs are met by fossil fuel-based sources. The recycling of paper uses a significantly lower amount of energy compared to the production of new paper. Used paper can be recycled up to seven times and offers several environmental benefits such as lowering GHG emissions, consuming less water, reducing landfill space, and most importantly preserving natural resources.

The Global Info Research report includes an overview of the development of the Wastepaper Management industry chain, the market status of Energy (Recycling, Landfill), Landfill Use (Recycling, Landfill), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Wastepaper Management.
