Wastewater grease interceptors are devices designed to separate grease and solid waste from effluents generated by restaurants, food processing industries, and similar sectors, preventing them from entering drainage systems and causing blockages or pollution. They operate on gravity separation principles, leveraging density differences between grease and water to trap floating fats at the top and solids at the bottom, while clarified water discharges from the middle. Constructed from corrosion-resistant materials like stainless steel or fiberglass, interceptors are easy to clean. They are categorized by capacity into small-scale (e.g., kitchen units) and large-scale (e.g., industrial units). Regular removal of accumulated grease and solids is essential for optimal performance. These devices protect sewer lines and treatment infrastructure, reduce downstream processing costs, and comply with environmental regulations.
