Abstracts

According to our (Global Info Research) latest study, the global Water Based Colloidal Graphite market size was valued at US\$ 904 million in 2024 and is forecast to a readjusted size of USD 1194 million by 2031 with a CAGR of 4.1% during review period.

Colloidal graphite is made up of very fine graphite flakes suspended in liquids such as water, alcohol, petroleum oil, castor oil, glycerin, etc. Colloidal graphite dispersed in distilled water is known as water-based colloidal graphite. Excellent lubricity, high conductivity, high adsorption, catalytic capabilities, and high plasticity are all characteristics of water-based colloidal graphite. It is used in cathode ray tubes. A high-voltage electrode is a conductive colloidal graphite coating applied to the inside of a cathode ray tube's glass envelope. The coating extends from just inside the CRT tube's neck to short the screen, covering the inside walls of the tube's 'bell.' It contains spring clips that press against the tube's walls, establishing contact with the aquadag, (a trade name for a water-based colloidal graphite coating) and allowing it to carry this high positive voltage.
