The water cold plate for server is a cooling component designed for high performance computing and data centres to effectively manage heat inside the server. It is typically constructed from a metal substrate (e.g. copper or aluminium) with internal channels that directly contact the heat-generating chip or component through flowing coolant. The cold plates are able to quickly conduct heat away, significantly lowering temperatures and improving system performance and stability. Compared to traditional air-cooling methods, water cold plates have significant advantages in terms of cooling efficiency and noise control, and are suitable for servers and high-density computing environments that require high heat dissipation capabilities.
