## Abstracts

The global Water-cooled Semi-hermetic Condensing Unit market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The water-cooled semi-closed condensing unit is a device used to cool and condense the working substance (usually steam or other gases). It is characterized by using water as the cooling medium.

**Water-cooled:** This means that the condensing unit uses water as the main cooling medium. Compared with air-cooled systems, water-cooled systems usually require a water circulation system to transfer heat to water through a water cooler or condenser, and take away hot water through the water circulation system.

**Semi-hermetic:** This means that the structure of the condensing unit is partially closed, but not completely sealed. This design may be to provide some convenience during maintenance and operation while still being able to maintain some environmental control.

**Condensing Unit:** This is a system that includes components such as a compressor, condenser, and expansion valve. The compressor compresses low-pressure, low-temperature gas into high-pressure, high-temperature gas, and then dissipates heat through the condenser to cool the gas and condense it into a liquid. This process is commonly used in refrigeration and air conditioning systems.
