## Abstracts

The global Water Deaeration Systems market size is expected to reach \$ 5036 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

A water deaeration system is a device specifically designed to remove dissolved gases (such as oxygen, carbon dioxide, and nitrogen) from water. It is widely used in boiler feedwater, heat exchange systems, and chemical process water applications. Its primary purpose is to prevent oxygen corrosion, cavitation, and decreased system efficiency. The core problem it solves is: by effectively removing dissolved gases from water, it prevents equipment corrosion, extends service life, and improves thermal efficiency, making it a crucial element in ensuring the safe operation of industrial systems. The average price of this product is approximately US\$5,100 per unit, with global sales of approximately 720,000 units.

The market prospect of water deaeration systems is highly promising, experiencing substantial growth and demand. Water deaeration systems play a crucial role in industries such as power generation, oil and gas, and water treatment, removing dissolved gases from water to improve its quality. The need for pure and deaerated water, especially in critical industrial processes, drives the demand for efficient and reliable deaeration systems. These systems offer benefits such as improved equipment performance, reduced corrosion, and enhanced process efficiency. As industries continue to prioritize water quality and efficient operations, the market prospects for water deaeration systems are projected to expand significantly, driven by the increased demand for purified water in various sectors.

This report studies the global Water Deaeration Systems production, demand, key
