According to our (Global Info Research) latest study, the global Water Demineralizer market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A water demineralizer is a device that removes impurities from tap water or well water. Natural water and tap water contain metallic components such as calcium and chlorine ions, which are removed by a water demineralizer. The amount of impurities reduced varies depending on the application. An ultra-pure water demineralizer is a device that produces water with very few impurities.

Water demineralizers range from devices that produce small amounts of pure water in laboratories to large-scale devices that produce large amounts of pure water in factories.
