## Abstracts

The global Water Ecological Restoration Service market size is expected to reach \$ 465 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

Water Ecological Restoration Service refers to the process of restoring the structure, function, and stability of damaged aquatic ecosystems through scientific interventions, bringing them back to or near their natural healthy state. Its core objective is to rebuild the water body's self-purification capacity, biodiversity, and ecological balance. It typically encompasses multiple dimensions of methods, including physical, chemical, and biological approaches, such as water purification, hydrological regulation, habitat reconstruction, vegetation restoration, and biological community building. Restoration targets various water bodies, including rivers, lakes, and wetlands, emphasizing a systematic, natural, and sustainable approach, aiming to improve water quality, enhance ecosystem services, and achieve harmonious coexistence between humans and water. This process is not only a technical engineering project but also a comprehensive management practice integrating ecological principles.

The cost of Water Ecological Restoration Services varies significantly globally, typically ranging from \$50 to \$500 per square meter. The cost structure is primarily comprised of engineering construction (40%-60%) and specialized technical services (20%-30%).

The competitive landscape results in generally low gross margins, averaging around 15%-25% across the industry. Higher profit margins are available for high-tech solutions and long-term operation and maintenance services.

The global development of Water Ecological Restoration Services exhibits significant regional differences. Developed regions such as Europe and the United States are in a leading position, having established systematic legal frameworks, mature technological systems (such as near-natural restoration), and stable markets, with a focus shifting towards holistic watershed management and climate resilience enhancement. The Asia-

Pacific region (especially represented by China and South Korea) is developing rapidly, with governments leading large-scale projects, a huge market, and diversified technological applications, transitioning from end-of-pipe pollution control to holistic ecosystem restoration. Developing countries are generally in the initial stages, heavily reliant on international aid and loans to address basic pollution and drinking water security crises, with restoration activities mostly being pilot projects and lacking long-term mechanisms. Globally, there is a trend of technology diffusion and localized innovation occurring simultaneously.
