Water resource management software is a specialized industry software system that integrates data acquisition, model simulation, real-time monitoring, intelligent analysis, and business process management, with the core objectives of water resource monitoring, scheduling, allocation, protection, operation and maintenance, and decision-making. It achieves efficient allocation, safe supply, economical utilization, pollution prevention and control, and intelligent operation and maintenance of water resources through the digital management of data on all elements, including surface water, groundwater, water supply, drainage, water environment, and water ecology. The main functional modules of water resource management software include: data acquisition and monitoring, hydrological analysis and simulation, scheduling and allocation management, water quality management, decision support system, and access control and business management. Water resource management software is widely used in urban water supply, sewage treatment, flood control and drought relief, irrigation district management, and water conservancy project operation and maintenance, and is a key technological support for realizing 'smart water conservancy' and sustainable water resource development.
