Abstracts

The global Water-Soluble UV Absorbers for Cosmetics market size is expected to reach \$ 346 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Water-soluble UV absorbers for cosmetics constitute a class of organic compounds (such as BP-4) that are soluble in water and capable of absorbing both UVA and UVB radiation. They protect the skin by converting ultraviolet light into harmless thermal energy; characterized by their refreshing, non-greasy feel and non-irritating nature, they are widely utilized in water-based sunscreens, water-based cosmetics, gels, and serums.

The upstream supply chain primarily relies on aromatic intermediates (such as *o*-phenylenediamine and resorcinol) as well as key sulfonation or phosphorylation reagents. The stability of this supply is directly influenced by fluctuations in the prices of basic petrochemical raw materials and by increasingly stringent environmental regulations within chemical industrial parks. Downstream applications cater directly to the consumer daily chemical market, finding extensive use in product formulations such as transparent sunscreen sprays, water-based gels, and oil-control day creams.

In 2025, global sales volume is projected to reach approximately 12,000 tons, with market prices ranging from \$10 to \$35 per kilogram. The industry's gross profit margin hovers in the range of 30% to 40%.
