Abstracts

Ceramic coating is a novel ceramic coating that can react organic and inorganic substances, thus combining the advantages of both. The hardness of the new generation of ceramic coatings can reach over 6H. It can withstand high temperatures up to 400 degrees and has a non stick effect. Its colors are also diverse. And it can be made into water-based ceramic coatings. The weather resistance and processing performance of water-based ceramic coatings are excellent, with resistance to both dirt and damage. Although traditional ceramic coatings were resistant to damage, they were prone to cracking when bent and processed on painted components. Fluorine containing resin coatings and organic coatings were easily damaged by sand, stones, dust, and other materials.

According to our (Global Info Research) latest study, the global Waterborne Ceramic Coatings market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
