Abstracts

The watertight bulkhead door is a door with watertightness on the watertight bulkhead. Commonly used are hinged watertight doors and sliding watertight doors. It is usually a metal door. The former has a light structure and is easy to open and close; the latter is used in places with limited water pressure and limited status. Hinged doors can be operated manually or hydraulically/electrically, while sliding doors are always hydraulic/electrically operated. Watertight doors minimise the risk of sinking by minimising the ingress of water during a grounding or collision or when the vessel suffers structural damage. Watertight closures are designed to withstand continuous immersion and are therefore located below the waterline in access to pipe tunnels, storerooms, bow thruster compartments and other mechanical spaces, or above the waterline in the form of pilot doors and bunker doors. All openings below the waterline must be watertight as they are to maintain the watertight integrity of the hull and can withstand water pressure from both sides.
