Wave Transparent Radome is a protective cover made of composite materials that is used to shield radar antennas from external environmental factors such as wind, rain, and hail. The radome is designed to be transparent to radio waves, allowing them to pass through with minimal attenuation or distortion. This allows the radar system to function effectively while being protected from the harsh external environment.

The upstream industry chain of Wave Transparent Radome includes the production of raw materials such as fiberglass, carbon fiber, and resin, as well as the manufacturing of radome components such as panels, frames, and fasteners. The downstream industry chain includes the installation and maintenance of radar systems that use Wave Transparent Radome.
