Abstracts

The global Wearable Drug Delivery Solutions market size is expected to reach \$ 544 million by 2032, rising at a market growth of 8.4% CAGR during the forecast period (2026-2032).

Wearable drug delivery solutions are medical devices integrating microelectronics, microfluidics, and sensor technologies, typically worn on the body in the form of patches, belts, or armbands. Through preset or real-time feedback programs, they continuously, precisely, and controllably deliver drugs into the patient's body, replacing traditional intermittent injections. Their core value lies in seamlessly integrating treatment from discrete hospital or home care scenarios into the patient's daily activities, improving efficacy and safety through automated control.

This field has broad prospects, and its development is moving from simple mechanical pumps towards intelligence, connectivity, and personalization. In the future, 'closed-loop systems' integrating biosensors such as continuous glucose monitoring will enable adaptive adjustment of drug dosage, becoming true 'artificial organs.' With advancements in materials science, painless microneedle patch technology is expected to greatly improve patient compliance. Driven by the needs of aging and chronic disease management, it will become a mainstream treatment option in areas such as diabetes and cardiovascular diseases, and will deeply integrate with digital healthcare platforms to achieve remote monitoring and dynamic optimization of treatment data, reshaping disease management models.
