The global Wearable Exoskeletons and Exosuits market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Wearable exoskeletons and exosuits are advanced robotic devices designed to augment and enhance human physical capabilities. These wearable technologies consist of a powered or unpowered external framework typically worn on the body, providing support, strength, and assistance to the user's limbs and muscles. Powered exoskeletons incorporate motors and actuators to actively amplify human strength, aiding in activities like lifting heavy objects, walking, or rehabilitation. On the other hand, unpowered exosuits use mechanical elements and lightweight materials to provide passive assistance, reducing the strain on the user's muscles and joints. The applications of wearable exoskeletons are diverse, ranging from medical rehabilitation and mobility assistance to industrial tasks that involve repetitive or strenuous movements. These technologies aim to improve the quality of life for individuals with mobility impairments, enhance worker productivity, and contribute to advancements in human-machine collaboration.
