The Wearable Intelligent Cochlear Implant System is an integrated wearable electronic device combining micro-sensors, wireless communication modules, and intelligent algorithms to restore auditory function in individuals with severe or profound sensorineural hearing loss. The system comprises external components (including microphone, speech processor, and transmitting coil) and an implanted electrode array, which captures environmental sound signals and converts them into electrical stimulation pulses to directly activate auditory nerve fibers. Its core advantage lies in the integration of AI-driven signal processing strategies, enabling dynamic adaptation to diverse acoustic environments while supporting remote parameter tuning and personalized speech coding schemes. This system significantly enhances speech recognition rates and auditory comfort in complex environments, representing a milestone in the convergence of biomedical engineering and wearable technology.
