Abstracts

The global Weather Modification Rocket market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Eliminating Smog and Haze Since artificial rainfall enhancement operations span a large time and space, use a small amount of catalyst, have low indicators, and have wide background conditions, the rocket operation system is also suitable for artificial rainfall enhancement operations. Due to the high launch height of rockets, they are more suitable for areas with lower altitudes or in the spring and autumn seasons when the zero-degree altitude is high. Therefore, rocket operation systems are widely used in artificial rain enhancement operations in both southern and northern my country. When carrying out rocket seeding of artificial ice cores in the operating area, the average monthly isotherm height of -6 to -12°C during the local operation period should be calculated in advance as a reference for the height of rocket flame seeding. The latent heat effect should also be considered at this time. The temperature in the cloud (updraft area) is generally slightly higher than the ambient temperature.
