## Abstracts

The global Weather-Resistive Barrier System market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

A weather-resistive barrier (WRB) system, also known as a weather barrier or building envelope system, is a construction component designed to protect a building from the damaging effects of weather and moisture. It acts as a primary line of defense against water infiltration, air leakage, and the potential for mold or rot. The WRB system is typically installed on the exterior surface of a building, underneath the exterior cladding (such as siding or stucco) and is composed of various materials. These materials may include building papers, house wraps, or synthetic membranes. The purpose of the WRB system is to provide a continuous layer of protection that prevents water or air from penetrating into the structure while allowing for the diffusion of trapped moisture to the exterior.
