According to our (Global Info Research) latest study, the global Weather Routing Service market size was valued at US\$ 1356 million in 2025 and is forecast to a readjusted size of US\$ 1962 million by 2032 with a CAGR of 5.5% during review period.

Weather Routing Service is a professional service that combines meteorological data, ocean/aeronautical hydrological information and navigation technology to provide ships, aircraft and other transportation vehicles with optimal route planning and real-time navigation advice. Its core goal is to help navigation tools avoid bad weather (such as typhoons, severe storms, thunderstorms, etc.), optimize navigation time, reduce fuel consumption, and improve navigation safety and economy.

AI-driven high-precision short-term forecast models (Nowcasting) and big data-based dynamic path planning systems have become the core driving force for the development of the industry. For example, the integration of the Beidou navigation system and meteorological data has made breakthroughs in China, improving the safety of routes in complex terrains such as mountainous areas and coastal areas. In addition, the construction of low-orbit meteorological satellite constellations has accelerated, and in the future, higher-frequency and higher-resolution meteorological data updates will be achieved, further improving the real-time and accuracy of route planning.

Weather route services are no longer limited to traditional aviation and navigation fields, but are gradually being applied to agricultural planting, energy and electricity, logistics and transportation, construction, insurance and finance, tourism and leisure, and other fields. For example, in agricultural planting, weather route service can help farmers choose the best time for sowing, fertilizing, and harvesting according to meteorological

conditions; in the field of energy and electricity, they can be used to optimize the operation of wind farms and adjust the operating status of wind turbines according to wind direction and wind speed.

Traditional weather route service providers usually require a lot of manpower to provide navigation plans, while modern optimization solutions are automated through digitalization, can monitor ships and data in real time, automatically identify the best routes, and remind operators when necessary, reducing manual intervention and improving efficiency.
