Well decommissioning refers to the engineering process of permanently and safely abandoning oil and gas wells at the end of their economic life, in accordance with regulations and environmental standards. Its core objectives include: establishing multiple independent cement barriers to isolate the producing and freshwater layers, cutting off oil and gas leakage pathways; removing the wellhead and restoring the original topography; and dismantling related surface facilities and subsea structures. The process typically encompasses scheme design, wellbore cleaning, casing cutting and recovery, cement plug installation, pressure testing, and final site remediation. Well decommissioning involves multiple disciplines, including petroleum engineering, materials science, and marine engineering. It is a necessary step to ensure public safety, prevent groundwater pollution, and fulfill environmental responsibilities, and is subject to strict supervision by energy regulatory agencies in various countries.
