## Abstracts

The global Western blot detection market size is expected to reach \$ 1190.2 million by 2029, rising at a market growth of 6.5% CAGR during the forecast period (2023-2029).

Western blotting is a laboratory technique used to detect a specific protein in a blood or tissue sample. The method involves using gel electrophoresis to separate the sample's proteins. The separated proteins are transferred out of the gel to the surface of a membrane. The membrane is exposed to an antibody specific to the target protein. The binding of the antibody is detected using a radioactive or chemical tag.

This report studies the global Western blot detection production, demand, key manufacturers, and key regions.
