## Abstracts

According to our (Global Info Research) latest study, the global Wet Biaxially Stretched Separator market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Wet biaxially stretched separator is a kind of lithium battery separator. It is made by mixing polyethylene (PE) and paraffin oil, heating and melting it to form a uniform mixture, then cooling it to phase separate, pressing it to obtain a diaphragm, and then the film is The sheet is stretched both vertically and horizontally to make the micropores on the separator nearly circular. Finally, solvent extraction is used to remove the residual paraffin oil, and a separator with an interconnected microporous structure is prepared. The advantages of the wet biaxially stretched separator are that it has small pore size, uniform distribution, good air permeability, and high mechanical strength, making it suitable for producing thinner separators. The disadvantage of wet biaxially stretched separators is that it has a high thermal shrinkage rate and requires heat treatment to reduce its dimensional stability. Wet biaxially stretched separators are mainly used in high-end power batteries and energy storage batteries.
