## Abstracts

The global Wet Film PCB Photoresist market size is expected to reach \$ 218 million by 2032, rising at a market growth of 12.4% CAGR during the forecast period (2026-2032).

Wet film PCB photoresist is a PCB pattern transfer material mainly composed of liquid or paste photosensitive resin system. It is usually composed of alkali soluble photosensitive resin, photoinitiator, active monomer, pigment or dye, filler, solvent, leveling agent, defoamer, adhesion promoter and stabilizer. It is coated on the surface of copper-clad laminate or PCB substrate by screen printing, rolling coating, spraying or curtain coating, and formed into circuit patterns or protective patterns through pre drying, exposure, development, etching, electroplating or film stripping processes. Compared with dry film photoresist, wet film PCB photoresist has the characteristics of flexible coating, high material utilization, suitable for various board structures and small batch and multi variety production. However, it has higher requirements for coating uniformity, film thickness control, development residue, adhesion, exposure window, and storage stability. It is mainly used for PCB inner and outer layer circuit production, anti etching protection, anti electroplating protection, solder mask patterns, character identification, and some high-density circuit processing scenarios. In 2025, global Wet Film PCB Photoresist production reached approximately 24,426 Tons, with an average global market price of around US\$ 3,681 per ton.

Wet film PCB photoresist is a key photosensitive chemical material in PCB manufacturing, and its demand is closely related to PCB production, fine routing, multi-layer board proportion, HDI board penetration, automotive electronics, server communication, industrial control, and consumer electronics product iteration. Around 2025, ordinary wet film photoresist still has cost advantages in conventional PCBs and mid to low end circuit boards, but high-end PCB manufacturing is upgrading towards

higher resolution, lower residue, narrower line width and spacing, higher yield, and LDI direct imaging adaptation, which makes high sensitivity, high adhesion, low ion pollution, and low defect wet film products have higher added value. In terms of industry competition, there is significant price pressure on general products, and customers are more concerned about stable supply and comprehensive costs; High end products are subject to limitations in resin synthesis capabilities, formulation technology, cleanliness control, batch consistency, and downstream PCB factory certification cycles, resulting in higher entry barriers. Future opportunities mainly come from AI servers, high-speed switches, automotive domain controllers, millimeter wave radar, energy storage, power management, industrial control equipment, and domestic PCB material substitution. Enterprises with customized formula development, on-site process services, environmentally friendly low VOC systems, and UV LED exposure adaptation capabilities are more likely to gain growth space.
