Wet Overflow Type Ball Mill is a grinding machine commonly used in mineral processing, where materials are ground into finer particles through the rotation of a cylindrical drum filled with grinding media, such as steel or ceramic balls, and a slurry mixture of water and ore. The mill operates in a continuous manner, with the slurry entering one end and ground materials exiting through an overflow mechanism at the other end. This design ensures that fine particles are discharged while coarser particles remain for further grinding, enhancing efficiency and uniformity in particle size. It is widely used in industries like mining, cement, and chemical production due to its ability to process large volumes and achieve precise grinding.
