According to our (Global Info Research) latest study, the global Wheel Aligner market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A 3D Wheel Aligner is where the front wheels of an automobile are aligned to the rear axle. It's called a 3D Wheel Aligner because the term "thrust" refers to the direction in which the rear wheels are pushing. This direction should match as closely as possible to the direction that the front wheels are facing when positioned forward; a mismatch here can create undue stress on your car's suspension system and wheels, as well as reduce power and your likelihood of getting good gas mileage.

A CCD Wheel Aligner, or front end alignment only deals with the two front wheels. These wheels are aligned straight toward the geometric center of the automobile, and the rear wheels and thrust direction are left alone. The theory is that the rear wheels should already be aligned with the center of the car. Depending on what type of car you have, a CCD Wheel Aligner may be all you need. In fact, before the widespread use of front wheel drive came into play, the two wheel alignments were the only alignments done for almost all cars on the road.

In a Laser Wheel Aligner, much as the name suggests, all four wheels on both axles are adjusted so they are parallel to each other, the ground, and the thrust angle of the car. Generally, the four wheel alignment should be done whenever possible and applicable, depending on the vehicle.

In China, Wheel Aligner key players include Robert Bosch GmbH, Delphi, Cormach, Honeywell, etc.

In terms of product, 3D Wheel Aligner is the largest segment, with a share over 65%. And in terms of application, the largest application is Heavy Vehicle, followed by Light Vehicle.
