wheeled mobile gamma camera is a specialized medical imaging device mounted on wheels, enabling it to be easily moved within a healthcare facility. It is designed to detect and capture gamma - ray emissions from a patient's body, which are typically emitted after the administration of a radioactive tracer. This device combines the functionality of traditional gamma cameras with enhanced mobility, allowing medical staff to perform nuclear medicine imaging procedures, such as single - photon emission computed tomography (SPECT), at the patient's bedside or in different departments without the need to transfer the patient to a fixed imaging suite. It helps to improve patient comfort, reduce the risk of complications associated with patient transfer, and increase the efficiency of nuclear medicine imaging services.
