According to our (Global Info Research) latest study, the global White Light Interferometry (WLI) market size was valued at USD 194.6 million in 2023 and is forecast to a readjusted size of USD 263.2 million by 2030 with a CAGR of 4.4% during review period.

The white light interferometer uses the white light interference technology as the principle. The light emitted by the light source is collimated by a beam splitter and split into two beams after being expanded and collimated. One beam is reflected by the measured surface, and the other beam is reflected by the reference mirror. Eventually convergence and interference occur, the microscope converts the topographical features of the measured surface into interference fringe signals, and measures the three-dimensional topography of the surface by measuring changes in the interference fringe.

Global core white light interferometry (WLI) manufacturers include AMETEK, Nikon, BRUKER, etc. The top three companies hold a share about 50%. The global white light interferometry (WLI) are mainly produced in North America and Europe, they occupied for a share over 65%.
