According to our (Global Info Research) latest study, the global Whole-Body MRI market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Whole-Body MRI is an imaging technique based on the principle of magnetic resonance imaging (MRI) that performs uninterrupted, full-coverage scans of the human body from the head to the lower limbs (or the entire body). It utilizes strong magnetic fields, radio frequency pulses, and a computer processing system to capture the resonance signals of hydrogen nuclei in water molecules within human tissues, generating multi-directional, multi-sequence images of the body's anatomical structures and functional metabolism. This allows for comprehensive imaging of all organs, soft tissues, bones, blood vessels, and other systems without the need for ionizing radiation.
