Whole house fan systems are energy-efficient ventilation systems designed to cool an entire house by exhausting hot air from the home and drawing in cooler outside air. Typically installed in the attic, a whole house fan pulls warm air from the living spaces through vents or windows and pushes it out through attic vents, effectively cooling down the house, especially during the evening and night when outdoor temperatures are cooler. These systems work best in regions with large temperature drops after sunset and can significantly reduce the need for air conditioning, lowering energy costs. Whole house fans are often quieter and more eco-friendly compared to traditional air conditioning systems, offering improved indoor air quality and quick home cooling.
