Abstracts

The global Wide-Body Mining Truck market size is expected to reach \$ 1796.4 million by 2029, rising at a market growth of 7.5% CAGR during the forecast period (2023-2029).

There are some limiting factors in the design and use of wide-body mining trucks. Here are some of the major limiting factors:

Dimensions: In order to improve transportation efficiency, the overall dimensions of the wide-body mining truck are widened and raised as much as possible. Its width far exceeds relevant national regulations. It cannot be driven on the highway and can only be driven within a limited mining area.

Speed: Wide-body mining trucks usually run at a slower speed, and different mining truck types and loads will affect their speed. For example, the maximum speed of some mining trucks is only 20 kilometers per hour.

Loading capacity: The loading capacity of wide-body mining trucks is usually larger, but it is also affected by many factors. For example, the type of loading material, loading location, material temperature, material humidity, etc. will all affect the loading capacity.

Operating costs: Wide-body mining trucks have higher operating costs, including fuel consumption, maintenance costs, labor costs, etc. Therefore, its application scope is also subject to certain limitations.

Road conditions: Wide-body mining trucks have higher requirements on road conditions and can only travel within specific mining areas. If the road conditions are not good, it

will have an impact on the performance and life of the mining truck.
