Abstracts

The global Wide Dynamic Range (WDR) Camera market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A WDR camera is a camera specifically designed to handle scenes with a wide dynamic range. Wide dynamic range scenes refer to environments with widely varying light intensities, such as strongly backlit or shadowed areas. In such scenes, traditional cameras may not be able to capture the details of the entire scene correctly, resulting in overexposed images or loss of details. Wide dynamic range cameras can achieve a wider dynamic range by using special sensors and image processing techniques to capture details in both bright and dark areas in one image. It can do this by automatically adjusting exposure, compositing images at multiple exposure levels, or through a special sensor structure. Wide dynamic cameras are widely used in security monitoring, traffic monitoring, industrial inspection and other fields. It can provide clearer and more accurate images, enable users to better observe and analyze details in the scene, and improve the effect of monitoring and detection.
