The global WiFi Temperature and Humidity Data Logger market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A WiFi temperature and humidity data logger is a device that measures and records temperature and humidity readings and has built-in WiFi connectivity capabilities. It allows users to monitor and access real-time and historical data remotely through a WiFi network.

These loggers typically consist of a built-in sensor or multiple sensors for measuring temperature and humidity, an internal memory for data storage, and a WiFi module for wireless communication. They are designed to connect to an existing WiFi network, enabling users to access the recorded data using various methods like web-based interfaces, mobile apps, or cloud platforms.

WiFi temperature and humidity data loggers provide the convenience of remote monitoring, eliminating the need for physically accessing the logger to retrieve data. Users can access the data from anywhere with an internet connection, allowing for real-time monitoring, data analysis, and making informed decisions based on the measurements.

These loggers often come with additional features such as customizable logging intervals, data visualization, configurable alarms or notifications, and integration with other systems or platforms. They are commonly used in various applications, including HVAC system monitoring, storage facilities, laboratories, greenhouses, and other environments where temperature and humidity conditions need to be monitored and

controlled.
