According to our (Global Info Research) latest study, the global Wind Difference Transmitter market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Wind pressure transmitter refers to a transmitter used to measure wind pressure. It is widely used in various industrial automatic control situations, involving fire protection, environmental protection, medical, aviation, industrial control and many other industries. The working principle of the wind pressure transmitter is to use the pressure of the wind to directly act on the strain diaphragm of the sensor, causing the strain diaphragm to produce tiny deformations proportional to the medium pressure. The resistance of the sensor changes, and the resistance of the sensor is amplified through the amplification circuit. Weak changes are amplified and the wind pressure value is converted into a standard 4-20Ma current output or 0-5V or 0-10V output.
