Abstracts

According to our (Global Info Research) latest study, the global Wind and Solar Power Forecast System market size was valued at US\$ 603 million in 2025 and is forecast to a readjusted size of US\$ 960 million by 2032 with a CAGR of 6.8% during review period.

The wind and solar power forecasting system is a specialized software solution designed for wind farms, photovoltaic (PV) power plants, new energy centralized control centers, and grid dispatching agencies. It automates the forecasting, rolling adjustment, and result management of future wind and solar power generation. The system typically integrates numerical weather prediction, satellite remote sensing, ground meteorological observation, and real-time SCADA operation data of wind turbines and photovoltaic power plants, and combines physical models, statistical models, machine learning and artificial intelligence algorithms to generate ultra-short-term, short-term, day-ahead, intraday and medium-term power prediction results.

The market for wind and solar power forecasting systems is primarily driven by the continued expansion of global installed wind and solar capacity, the rising share of renewable energy integrated into the grid, and the increasing marketization of the power sector. Because wind and solar power generation are characterized by significant intermittency, volatility, and weather dependence, the accuracy of the power grid's future power generation is directly related to supply and demand balance, reserve capacity configuration, and system security as the proportion of new energy sources increases. Furthermore, with new energy companies participating in day-ahead, intraday, and real-time electricity markets, forecasting errors will directly affect deviation assessments and trading revenues. Therefore, high-precision power forecasting is gradually becoming a basic configuration for new energy power plants and dispatching

agencies. Meanwhile, the rapid development of energy storage, virtual power plants, integrated wind-solar-storage systems, and centralized operation models for new energy sources has placed higher demands on multi-site, combined-level, and high-frequency rolling forecasts. The continuous maturation of high-resolution numerical weather prediction, satellite cloud images, real-time SCADA data, cloud computing, and AI and deep learning technologies has continuously improved forecast accuracy, automation levels, and adaptability to complex weather conditions, jointly driving the evolution of wind and solar power forecasting systems from traditional site auxiliary software to core digital systems for new energy dispatching, trading, and intelligent operation.
