Abstracts

According to our (Global Info Research) latest study, the global Wind and Solar Power Forecasting System market size was valued at US$ 603 million in 2025 and is forecast to a readjusted size of US$ 960 million by 2032 with a CAGR of 6.8% during review period.

The wind and solar power forecasting system is a specialized software and digital system designed for wind farms, photovoltaic power plants, new energy control centers, power trading institutions, and grid dispatching departments. It forecasts, revises, and manages future wind and solar power generation.

The development of the wind and solar power forecasting system market is primarily driven by the continuous expansion of global wind and solar power installations, the increasing penetration of new energy sources in the power system, and the accelerated pace of power market reforms. Due to the significant randomness and volatility of wind speed, solar irradiance, and cloud cover variations, the integration of large-scale wind and solar power sources places higher demands on power system supply-demand balance, reserve capacity configuration, and safe dispatch. This makes high-precision, real-time, and continuously updated power forecasting a crucial tool for the operation of new energy power plants and the power grid. Meanwhile, the development of day-ahead, intraday, and real-time electricity markets has made forecasting errors directly affect the deviation costs and trading revenues of power generation companies, further increasing operators' emphasis on forecasting accuracy. In addition, the development of large-scale new energy bases, offshore wind power, wind-solar-storage integration, energy storage systems, virtual power plants, and centralized operation of multiple power stations has also driven the expansion of forecasting demand from single power

stations to asset portfolios and regional forecasting. With the continuous advancement of high-resolution NWP, satellite cloud imagery, SCADA data, cloud computing, and AI and machine learning technologies, prediction accuracy, update frequency, and automation levels are constantly improving, further driving the evolution of wind and solar power prediction systems from traditional auxiliary tools to core digital systems for new energy dispatching, trading, and intelligent operation.
