The global Wind Power Pultruded Fiberglass Plates market size is expected to reach \$ 1139 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

In 2025, global Wind Power Pultruded Fiberglass Plates production reached approximately 350 k tons, with an average global market price of around US\$2,100 per ton. Wind power pultruded glass fibre plates are composite plates made specifically for use in wind turbine blades through the pultrusion process. Its main reinforcing material is glass fibre. Pultrusion is a manufacturing method for composite materials. For wind power pultruded glass fibre plates, it starts with continuous glass fibres. These fibres are drawn through a resin-impregnation system. The resin, which can be epoxy resin, polyester resin, or vinyl - ester resin, coats and saturates the fibres. The resin - impregnated glass fibres then pass through a heated die that has a specific cross-sectional shape designed for the wind power application.

The core driver of global demand for wind power pultruded fiberglass plates comes from the policy orientation of renewable energy development and the implementation of wind power installation planning worldwide. The large-scale advancement of onshore and offshore wind power projects directly drives the demand expansion of core upstream materials in the industrial chain. The trend of larger and lighter wind turbine blades promotes the continuous growth of the application penetration rate of pultruded fiberglass plates in blade main beam structures, and the stability of material properties and maturity of production technology have become core elements of market competition. The global production capacity layout is highly matched with the regional agglomeration characteristics of the wind power industrial chain. Product technical certification barriers and long-term cooperation stickiness of downstream customers

constitute the core threshold for market entry. The continuous advancement of global carbon neutrality goals provides stable policy support for the industry's long-term development, while the cyclical fluctuation of raw material prices is the core variable affecting industry profitability, and the industry's overall development is deeply bound to the global energy transition process.
