Abstracts

The global Wind Turbine Decommissioning market size is expected to reach \$ 1763 million by 2032, rising at a market growth of 7.2% CAGR during the forecast period (2026-2032).

Wind turbine decommissioning refers to the planned cessation of operation and dismantling of wind turbines after they reach their design life (typically 20-25 years) or due to technical, economic, safety, or environmental regulations. Its core components include: shutdown and depressurization, blade segmentation and cutting, tower segmentation and hoisting, nacelle dismantling, foundation demolition, and site ecological restoration. Decommissioned materials must be classified and recycled or disposed of environmentally friendly? fiberglass/carbon fiber blades, being difficult to degrade, are often mechanically crushed, pyrolyzed, or co-processed in cement kilns; metal components such as steel, copper, and gearboxes are recycled and smelted. Some blades can also be reused in building formwork, sound barriers, and other applications. Wind power decommissioning must comply with national and local regulations regarding solid waste management, soil remediation, and occupational health and safety. This stage is crucial for achieving a green closed loop throughout the entire life cycle of wind power and preventing the generation of new types of solid waste pollution.

Global wind turbine decommissioning exhibits regional differentiation: Europe is the most mature market, with Denmark, Germany, and Spain having established recycling industry chains. Mandatory landfill bans on blades are driving the development of pyrolysis and cement kiln co-processing technologies. The US primarily focuses on 'large-scale replacement of small-scale' refurbishment, with the scale of decommissioning fluctuating according to PTC policies. Future trends include high-value blade recycling (carbon fiber recycling, building reuse) and the widespread

adoption of automated dismantling equipment. Major obstacles include high blade recycling costs, poor economic viability, complex cross-regional transportation regulations, and insufficient recycling capacity. Dynamically, the EU is promoting full-cycle design standards for wind turbine blades, while China has launched pilot programs for the standardized recycling of decommissioned wind power equipment.
