Winding wire for transformers is a specialized type of conductive wire used to create the coils within power, distribution, and signal transformers. Typically made of copper or aluminum and coated with an insulating layer such as enamel, film, or paper, these wires are engineered to withstand high temperatures, electrical stress, and mechanical forces during operation. The wire's geometry—whether round or rectangular—is selected based on space efficiency, cooling requirements, and electromagnetic performance. High-quality winding wire ensures low energy loss, improved thermal management, and long-term reliability, making it a critical component in the efficient performance of modern transformers across industrial, utility, and electronic applications.
