According to our (Global Info Research) latest study, the global Wire Wound Common Mode Inductors market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Wire-wound common-mode inductors are a common inductive device, which are mainly used for filtering, isolation and suppression of common-mode interference in circuits. It is characterized by high inductance value, low DC resistance and good high-frequency characteristics, so it has been widely used in electronic equipment.

The structure of the wire-wound common mode inductor is relatively simple. It consists of two coils wound in the same direction. The magnetic barley of these two coils is co-thought. When the current flows through its two coils, a magnetic field will be generated in the magnetic field, and this magnetic field will pass through the other coil: the plexus and generate an induced electromotive force in the other coil, thereby realizing the effect of inductance.
