The global Wireless Charging IC market size is expected to reach \$ 4751 million by 2032, rising at a market growth of 17.6% CAGR during the forecast period (2026-2032).

Wireless Charging IC refers to a class of power-management and control integrated circuits used in wireless power transfer systems. It is mainly responsible for transmitter-side power conversion, coil driving, power regulation, foreign object detection, communication demodulation, protocol control, receiver-side rectification, voltage regulation, battery charging management, and system protection. A typical wireless charging system consists of a transmitter and a receiver: the transmitter coil generates an alternating magnetic field, while the receiver coil induces voltage and converts it into usable DC power. Therefore, wireless charging ICs are commonly divided into transmitter controller ICs, receiver ICs, transceiver ICs, wireless power-stage ICs, and authentication or security ICs. They are widely used in smartphones, TWS earbuds, smartwatches, tablets, power banks, in-vehicle wireless chargers, industrial devices, medical equipment, and smart-home terminals, and are core components for implementing Qi, Qi2, EPP, BPP, MPP, and proprietary fast-charging protocols. In 2025, the average price of global wireless charging chips was approximately \$0.7 per pcs.

The main growth drivers for the wireless charging IC market come from the wireless trend in consumer electronics, smart-cockpit upgrades in vehicles, the expansion of the Qi2 magnetic ecosystem, and the demand for higher-power fast-charging experiences. Smartphones, earbuds, watches, tablets, and power banks continue to pursue simplified interfaces, waterproof and dustproof designs, thinner form factors, and multi-device charging, which drives receiver ICs toward higher integration, higher conversion efficiency, lower standby power, and smaller packages. Meanwhile, Qi2 improves coil

alignment and user experience through magnetic positioning, and Qi2 25W further raises standardized wireless charging power, gradually turning wireless charging from a convenience feature into a mainstream fast-charging function.

Automotive, industrial, and medical applications are becoming important incremental markets beyond smartphones. In-vehicle wireless charging is expanding from high-end models to broader vehicle segments, creating higher requirements for AEC-Q100 qualification, EMC performance, foreign object detection, thermal management, and multi-protocol compatibility. Industrial and medical equipment place stronger emphasis on sealed designs, contactless operation, rotational or movable power delivery, easy cleaning, and long-term reliability. As transmitter controllers, receiver rectifiers, power MOSFETs, USB-C PD, authentication ICs, and MCU functions become increasingly integrated, wireless charging ICs are evolving from standalone controller chips into system-level SoC solutions, raising the value per device and expanding opportunities for domestic substitution.

Global Wireless Charging IC key players include STMicroelectronics, Broadcom, ConvenientPower Semiconductor, Renesas Electronics, NuVolta Technologies, etc. Global top five manufacturers hold a share over 75%.
