Wireless Charging is the transmission of electrical power from a power source to a receiving device without any physical connections. It delivers a number of benefits to users like preventing electric shocks due to the power cord connection's contacts, and increase the convenience and ubiquity for the charging of everyday devices. In general, there are three types of wireless charging technologies currently existing; radio frequency-based wireless charging, electromagnetic induction and resonant wireless charging.

Growth prospects for the market seem very bullish at the moment on account of growing adoption of this technology in consumer electronics devices such as smartphones and tablets. Other sectors, such as automotive, industrial, healthcare, and defense are also expected to spur industry growth as end-users have exhibited a tendency towards minimizing the hassles of wires for powering various devices. This is relatively a new industry and currently is in its growth phase. Heavy investments are being made by key industry participants on R&D activities to enhance existing features and functionalities. A major focus is on improving the power transmission range that can facilitate charging of devices wirelessly over long distances.
